Adapting Urban Forests to a Changing Climate

- We developed **Strategies, Approaches, and Tactics** for adapting urban forests to climate change
 - Modeled on a document focused on NE region forests as a whole
- Urban systems face many specific challenges under climate change that differ from other landscapes
 - Social, Political, Ecological
- Urban Forests defined as: all trees and tree-dominated ecosystems within a metropolitan region
 - Tactics in many cases were split into “Developed Urban Sites” and “Urban Natural Areas”

Strategy 1: Sustain or Rebuild Fundamental Ecological Function

- Approach 1.1: *Plant trees to sites*
- Approach 1.2: *Restore and rebuild soil in urban areas*
 - Adding organic matter to support
- Approach 1.3: *Permeable paving,*
- Approach 1.4: *Remove mowed turf*
 - Removing mowed turf – replace with organic matter
- Approach 1.5: *Restore or maintain function*

Strategy 2: Reduce the impact of biological stressors

- *the ability of forests to resist*
- *levels - 5-10-20 rule*
- *an appropriate and feasible*
- *introductions and est*
- *invasive plant species and remove existing invasive*
- Limiting use of kno

Strategy 3: Reduce the susceptibility and severity of damage from disturbances

- Approach 3.1: *Manage forest structure and composition to reduce risk or severity of wildfire.*
- Approach 3.2: *Maintain urban trees to minimize the likelihood of catastrophic tree failure*
 - Maintaining trees on a regular pruning cycle, using ANSI standards and BMPs as guidelines for tree care and maintenance

Strategy 4: Respond quickly to disturbance

- Approach 4.1: *Promptly remove major hazards*
- Approach 4.2: *Assess severity of damage and prioritize remediation*
 - Implementing appropriate tree crown restoration pruning strategies for less severely damaged trees
- Approach 4.3: *Promptly revegetate sites after disturbance*

Strategy 5: Maintain or create refugia

- Approach 5.1: *Identify, prioritize, maintain, restore, and recreate unique habitats*
 - Preservation and restoration of remnant natural areas
- Approach 5.2 & 3: *Prioritize and maintain sensitive or at-risk species or communities and Establish artificial reserves*
 - Including at-risk species (or species that provide habitat) in urban park/street/campus plantings whenever possible or feasible

Strategy 6: Maintain and enhance species and structural diversity

- Approach 6.1: *Promote diverse age structure*
 - Managing loss over time so there can be a variable age-structure - proactively planning for replacement as trees are lost

- Rotating removals at removal geographic

- Approach 6.2: *Maintain and enhance urban tree canopy and cover*
 - Promote urban tree canopy and cover
 - Using root protection and cover
 - Rooting

- Approach 6.3: *Legacies*
 - Maintaining trees during construction
 - Urban a

Strategy 7: Increase ecosystem redundancy across the landscape

- Approach 7.1: *Manage habitats over a range of sites, conditions, land-uses, and ownerships*
 - Managing for underrepresented species/communities/ecosystems in urban habitats (esp. parks, campuses) to offset potential losses elsewhere
- Approach 7.2: *Expand or buffer*

Strategy 8: Protect and restore natural landscape

2010 Oak Ecosystem Parcels by Size

- Approach 8.1: *Reduce landscape fragmentation*
 - Managing areas adjacent to natural structure – e.g. continuous canopy

Strategy 9: Enhance genetic diversity

- Approach 9.1: *Use genetic material from across a great*
 - To increase resiliency to “future climate”

genetic material

this area

Strategy 9: Enhance genetic diversity

- Approach 9.2: *Favor existing genotypes that are well adapted to new climatic conditions*
- Approach 9.3: *Promote creation of new genotypes that can be better adapted to future threats and conditions*
 - Create new genotypes and cultivars of currently planted species that will be best adapted to climate changes

Vulnerability Assessment

Forest Adaptation Resources

Demonstration Projects

Urban

Urban forests will experience local climate change impacts in the coming decades. To reduce these impacts, urban forest managers will need to adapt their management, but often lack the specialized knowledge and tools to do so.

The overall goal of this effort is to ensure that urban forests will continue to provide benefits to the people that live in urban communities as the climate changes. The Urban Forestry Framework project is in the beginning stages of planning and development. We are seeking urban forestry professionals from variety of organizations, both public and private, to work toward this goal by accomplishing the following objectives:

- Engage with communities across the Northeast, Mid-Atlantic, and Midwest that are interested in adapting their urban forest management to climate change.
- Work with these communities to assess the vulnerability of their urban forests to climate change.
